Art Unit: 1745

1. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Skala et al. describe a method for controlling the oxidant injection to a reactor in combination with a fuel cell; Ueda et al. set forth means to control the reactant gas supplying unit and the discharged reactant gas flow in a fuel cell system and Keskula et al. disclose a control system and method to deliver oxidant to a fuel cell including utilizing various signals and commands to determine oxidant amount.

2. The following is an examiner's statement of reasons for allowance: none of the prior art of record teach the method for controlling the flow rate of an oxidizer in a fuel cell including a compressor that provides oxidizer to the cell, a back pressure valve to control pressure of the oxidizer and which is located downstream of the cell and a control device that controls the compressor, the valve and the cell. The method includes the steps of calculating an oxidizer pressure command and an oxidizer flow rate command that is determined by the control device on a given electrical current command. A first flow rate and a second flow rate, which rates are each based on various oxidizer flow rates are compared and then the oxidizer flow rate command is regulated to be within the range of the second flow rate to the first flow rate. None of the art of record set forth these specific steps of controlling the oxidizer rate in a fuel cell. The closest prior art, Keskula et al., does not utilize the same commands as applicant has claimed including those listed above. No comparison of different flow rates is taught in the reference to Keskula et al.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably
